EMBO J. 11.4693-4704(1992).
-i- FUNCTION: TRANSCRIPTION FACTOR INVOLVED IN THE GENETI
FLOWER DEVELOPMENT. ACTS IN CONJUNCTION WITH DEFICIES.
-i- SUBSCELLULAR LOCATION: Nuclear.
-i- MISCELLANDOUS: MITATIONS IN GLO CAUSE TRANSFORMATION
INTO SEPALS AND STAMINA INTO CARPELS.
-i- SIMILARITY: Contains 1 K-box dimerization domain.
-i- SIMILARITY: Contains 1 MADS-box domain.

                                                                                                                                 control of flower development. Is required for normal development of petals and stamens in the wild-type flower. Forms an heterodimer with APETALA1 that is required for noting that of both AP3 and PI genes. AP3/PI heterodimer interacts with APETALA1 or SEPALLATA3 to form a ternary complex that could be responsible for the regulation of the genes involved in the flower
                                                                                     development.
SUBUNIT: Forms an he
CArG-box sequences.

-!- SUBCELULAR LOCATION: Nuclear (By similarity).
-!- TISSUE SPECIFICITY: Expression specific for female reproductive structures: strong at the adaxial base of the cupules, where ovules will later develop, then in the outermost cell layer of the nucellus, in the inner envelope, and in the inner half of the middle envelope at late stage of ovule development.
-!- SIMILARITY: Contains 1 K-box dimerization domain.
-!- SIMILARITY: Contains 1 MADS-box domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "A novel WADS-box gene subfamily with s class B floral homeotic genes.", Mol. Genet. Genomics 266:942-950(2002).

                                                                                                                                                                                                                                                                                                                                                       FUNCTION: Probable transcription factor.

SUBCELIULAR LOCATION: Nuclear (By similarity).

SUBCELIULAR LOCATION: Nuclear (By similarity).

TISSUE SPECIFICITY: Strong expression in female inflorescences (tassel (ears), but also weak expression in male inflorescences (tassel At early stages of the development of the female spiklet, at expressed in all organ primordia but later restricted to the ovand the developing silk. At very late stages of development, expression becomes restricted to parts of the silk.

SIMILARITY: Contains 1 K-box dimerization domain.

SIMILARITY: Contains 1 MADS-box domain.

"Petrunia hybrida MADS-box transcription factor FBP24.";
Submitted (JAN-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Probable transcription factor.
-!- SUBCELLULAR LOCATION: Nuclear (By similarity).
-!- SIMILARITY: Contains 1 K-box dimerization domain.
-!- SIMILARITY: Contains 1 MADS-box domain.
-!- CAUTION: It is uncertain whether Met-1 or Met-4 is the initiator.

TISSUE SPECIFICITY: Expressed in petals and stamens.
INDUCTION: Positively regulated by the meristem identity
APETALA1 and LEAFY with the cooperation of UFO.
MISCELLANEOUS: Mutations in Ap3 cause transformation of pinto sepals and stamina into carpels.
SIMILARITY: Contains 1 K-box dimerization domain.
SIMILARITY: Contains 1 MADS-box domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: probable transcription factor involved in the genetic control of flower development. Is required for normal development of petals and stamens in the wild-type flower. Forms an heterodimer with PISTILLATA that is required for autoregulation of both AP3 and PI genes. AP3/PI heterodimer interacts with APETALA1 or SEPALLATA3 to form a ternary complex that could be responsible for the regulation of the genes involved in the flower
                                                                                                                                                                                                                                                                                                                                         M86357; AAA32740.1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      42:387-402(1999)

```
but not in roots, stems, leaves, seedlings or siliques valves.

Expression in seed coat is confined to the endothelium layer.

-!- DEVELOPMENTAL STAGE: Expressed during seed development.

-!- MISCELLANEOUS: The two isoforms were always coexpressed in the tissues investigated. The pigmentation of the chalaza-micropyle region is not under the control of ABS, as opposed to the pigmentation of the seed body.

-!- SIMILARITY: Contains 1 K-box dimerization domain.

-!- SIMILARITY: Contains 1 MADS-box domain.

-!- CAUTION: Ref. 2 sequence differs from that shown due to erroneous gene model prediction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nature 409:525-529(2001).

-- FUNCTION: Probable transcription factor active in inflorescence development and floral organogenesis. Functions with SEPALLATA1/AGL2 and SEPALLATA2/AGL4 to ensure proper development of petals, stamens and carpels and to prevent the indeterminate growth of the flower meristem. Interacts with APETALA1, AGAMOUS or APETALA3/PISTILIATA to form complexes, that could be involved in genes regulation during floral meristem development.

SUBUNIT: Heterodimer with API or AG capable of binding to CArG-box sequences. Binds API/PI to form a ternary complex.

-- SUBCELLULAR LOCATION: Nuclear (By Similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEDLINE=98079237; PubMed=9418042; Fan H.-Y., Hu Y., Tudor M., Ma H.; "Specific interactions between the K domains of AG and AGLs, members of the MADS domain family of DNA binding proteins."; Plant J. 12:999-1010(1997).

IsoId=022456-2; Sequence=VSP_008893;
Note=May be due to a competing acceptor splice site. No experimental confirmation available;
EXPELOPMENTAL STAGE: Expressed early during flower development within petals, stamens, and carpels.
MISCELLANEOUS: Triple mutations in the SEP1, SEP2 and SEP3 genes result in the replacement of the stamens and petals by sepals and of the carpels by a new mutant flower with sepaloid organs.
SIMILARITY: Contains 1 K-Dox dimerization domain.
SIMILARITY: Contains 1 MADS-box domain.

The fruits support mechanical harvesting and are not subject to physical wounding during transportation.
-I- SIMILARITY: Contains 1 K-box dimerization domain.
-I- SIMILARITY: Contains 1 MADS-box domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "JOINTLESS is a MADS-box gene controlling tomato flower abscission
